Types of Flux Linkage

Internal Flux Linkage

- Produced by the magnetic flux inside the conductor.
- Exists because the conductor has a finite radius.
- Depends on the current distribution within the conductor.
- Contributes only a small portion of the total inductance.

External Flux Linkage

- Produced by the magnetic flux outside the conductor.
- Extends from the conductor surface to the return path.
- Depends on conductor spacing and arrangement.
- Contributes the major portion of the transmission line inductance.
